AMENDMENTS TO THE CLAIMS

Please cancel claim 50 and amend claims 28, 36 and 51 as follows (a complete listing of the claims is provided below pursuant to 37 CFR 1.121):

Claim 1. (Cancelled).

- 2. (Previously Presented) The method of making a catheter according to claim
 2 8, further comprising the step of anchoring the group of filaments at or near a proximal
 3 end of the core member before winding the group of filaments onto the core member.
 - 3. (Previously Presented) The method of making a catheter according to claim 2, wherein the group of filaments is wound onto the core member continuously from the proximal end of the core member to a distal end thereof and then back to the proximal end.

Claim 4. (Cancelled).

- 5. (Previously Presented) The method of making a catheter according to claim
 2 8, wherein the core member is a mandrel on which the catheter is formed.
 - 6. (Previously Presented) The method of making a catheter according to claim

PATENT APPLICATION

28, wherein the core member is a substrate that forms an inner lining of the catheter. 2

Claims 7 to 23. (Cancelled).

- 24. (Previously Presented) The method of making a catheter according to claim 1 28, wherein said group of filaments are wound with a variable pitch such that a filament 2 group spacing at a distal end of the core member is narrower than a filament group 3 4 spacing at a proximal end of the core member.
 - Claims 25 to 27. (Cancelled).
- 28. (Currently Amended) A method of making a catheter, comprising the steps 1 2 of:
 - winding a filament onto a core member while rotating the core member relative to a filament source and passing the filament source in a first direction of axial movement relative to the core member; and
 - reversing a direction of axial movement of the filament source while continuing to wind the filament onto the core member, whereby the filament is continuously wound onto the core member to form a first fibrous layer as the filament source is moved relative to the core member from a first axial position to a second axial position and then back to the first axial position;

PATENT APPLICATION

11 wherein said step of winding a filament comprises winding a group of filaments 12 simultaneously; and 13 further comprising the step of providing a guide assembly having a filament 14 engaging surface, and arranging said guide assembly such that the filament engaging 15 surface lies in a plane which is generally perpendicular to a longitudinal axis of the core 16 member, whereby the guide assembly causes the filaments within said group of filaments 17 to be positioned side-by-side and packed tightly against one another as the group of 18 filaments are wound onto the core member; and 19 further comprising the step of passing the group of filaments through the guide assembly to orient the group of filaments into the plane which is generally perpendicular 20 21 to the longitudinal axis of the core member, and causing the filaments to be naturally 22 reoriented into a plane which is generally parallel to the longitudinal axis of the core 23 member and packed tightly against one another as the group of filaments are wound onto 24 the core member.

29. (Original) The method of making a catheter according to claim 28, further comprising the step of varying a rotation speed of the core member or a translation speed of the filament source along the core member to vary a pitch of the group of filaments being wound onto the core member.

Claim 30. (Cancelled).

Docket No. PUR-020 Serial No. 10/735,352

PATENT APPLICATION

- 31. (Previously Presented) The method of making a catheter according to claim
 36, further comprising the step of varying a rotation speed of the core member or a
 translation speed of the source of filaments along the core member to vary a pitch of the
 group of filaments being wound onto the core member.
 - 32. (Previously Presented) The method of making a catheter according to claim 36, wherein said group of filaments are wound with a variable pitch such that a filament group spacing at a distal end of the core member is narrower than a filament group spacing at a proximal end of the core member.

Claims 33 to 35. (Cancelled).

36. (Currently Amended) A method of making a catheter, comprising the steps
 step of:

winding a group of filaments simultaneously onto a core member while rotating the core member relative to a source of said filaments and passing the source of filaments in a first direction of axial movement relative to the core member;

further comprising the step of providing a guide assembly having a filament engaging surface, and arranging said guide assembly such that the filament engaging surface lies in a plane which is generally perpendicular to a longitudinal axis of the core member, whereby the guide assembly causes the filaments within said group of filaments

PATENT APPLICATION

to be positioned side-by-side and packed tightly against one another as the group of
filaments are wound onto the core member; and

passing the group of filaments through the guide assembly to orient the group of
filaments into the plane which is generally perpendicular to the longitudinal axis of the
core member, and causing the filaments to be naturally reoriented into a plane which is
generally parallel to the longitudinal axis of the core member and packed tightly against
one another as the group of filaments are wound onto the core member.

37. (Previously Presented) The method of making a catheter according to claim 36, further comprising the step of reversing a direction of axial movement of the source of filaments relative to the core member while continuing to wind the group of filaments onto the core member, whereby the filaments are continuously wound onto the core member as the source of filaments is moved relative to the core member from a first axial position to a second axial position and then back to the first axial position.

Claims 38 to 50. (Cancelled).

51. (Currently Amended) A method of making a catheter, comprising the steps

of:

anchoring a group of filaments to a core member at a proximal end of the catheter;

winding the group of filaments simultaneously onto the core member while
